- How to confirm prices and update product cost during a sale
- How to change the register cart position

How to show or hide discounts and quantity controls

Use these controls to simplify checkout and limit the changes employees can make from the register.

Hide register discounts

1. Open **Settings > Register**.
2. Enable **Hide Discount** to remove discount controls from the cart and item-editing flow.
3. Save Register settings.

Use this when discounts require a separate approval process or should not be available during normal checkout.

Hide quantity controls

1. Enable **Hide Quantity**.
2. Save Register settings.

This prevents employees from adjusting an item’s quantity at the register. It is useful when items are normally scanned or entered one at a time.

These settings change the visible register controls. They do not replace employee permissions or inventory rules.

How to confirm prices and update product cost during a sale

Price and cost confirmation settings help businesses that need employees to verify values while adding an item to a sale.

Confirm prices

1. Open **Settings > Register**.
2. Enable **Confirm Cost and Selling Price** when available.
3. Save the settings.

Permitted employees will be prompted to confirm the selling price, or the cost and selling price, before the item is added. Availability depends on the brand and employee permissions.

Update product cost after a sale

1. Enable **Update Product Cost After Each Sale**.
2. Save the settings.

When enabled, a cost entered during the sale becomes the product’s purchase cost for that location and can be used automatically on the next sale. Enable this only when sale-time cost entry is part of your workflow.

Changing product cost affects future profitability information. Train authorized employees before enabling this option.

How to change the register cart position

Supported touch-register layouts can place the cart on the left or right side of the screen.

Change the cart position

1. Open **Settings > Register**.
2. Find **Cart Position**.
3. Select **Left** or **Right**.
4. Save the Register settings.

Choose the side that is most comfortable for the device placement and the employee’s normal checkout motion. This option appears only on supported touch-oriented register layouts.
